TITLE: The Development of Meromorphic Functions in the Generalized Maclaurin Series (Razlozheniye meromorfnykh funktsiy v obobshchennyy ryad Maklorena)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 4, pp 707-710 (USSR)

ABSTRACT: Let $\{a_k\}$ be a complex number sequence, $1 < |a_0| \leqslant |a_1| \leqslant \dots \leqslant |a_n| \leqslant \dots$, $\lim\limits_{k\to\infty} |a_k| = \infty$. Let $R\{a_k\}$ be the class of functions $\Phi(z)$ meromorphic in the whole plane and having poles in the points $\{a_k\}$. Let $\alpha_k = \frac{1}{\bar{a}_k}$. Given the system

$$\varphi_0(z) = \left(\frac{1-|\alpha_0|^2}{2\pi}\right)^{1/2} \frac{1}{1-\bar{\alpha}_0 z}$$

$$\varphi_n(z) = \left(\frac{1-|\alpha_n|^2}{2\pi}\right)^{1/2} \frac{1}{1-\bar{\alpha}_n z} \prod_{k=0}^{n-1} \frac{z-\alpha_k}{1-\bar{\alpha}_k z}, \quad n = 1,2,\dots.$$

Card 1/3

Theorem: Let $\phi(z) \in R\left\{\frac{1}{\bar{\alpha}_k}\right\}$. Then there holds the development

$$\phi(z) = \sum_{n=0}^{\infty} c_n \varphi_n(z) , \quad c_n = \int_{|\zeta|=1} \phi(\zeta)\overline{\varphi_n(\zeta)}\,|d\zeta|, \quad n = 0,1,2,\dots$$

The development converges uniformly and absolutely in every bounded and closed domain not containing the points $\left\{\frac{1}{\bar{\alpha}_k}\right\}$. For the coefficients c_n there also holds the representation

$$c_n = \frac{\sqrt{(1-|\alpha_n|^2)(1-|\alpha_{n+1}|^2)}}{2\pi i} \int_{|\zeta|=R} \phi(\zeta) \frac{d\zeta}{(1-\bar{\alpha}_n\zeta)(1-\bar{\alpha}_{n+1}\zeta)\varphi_{n+1}(\zeta)} ,$$

AUTHOR: Dzhrbashyan, M.M., Academician, Academy of Sciences, Armyanskaya SSR

TITLE: Quasi-Isometric Mapping of the Spaces of Functions $L^2_{\sigma_1}(a_1,b_1)$, $L^2_{\sigma_2}(a_2,b_2)$

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 3, pp 456-459 (USSR)

ABSTRACT: Let $\sigma_k(x)$ $(k=1,2)$ be a nondecreasing function defined on (a_k,b_k) and continuous from the right which is of bounded variation on $[\alpha,\beta]\subset(a_k,b_k)$. To the class $L^2_{\sigma_k}(a_k,b_k)$ there belong all $f(x)$ being σ_k-measurable on (a_k,b_k) and for which it is $\int\limits_{a_k}^{b_k}|f(x)|^2 d\sigma_k(x) < +\infty$, the integral understood in the sense of Lebesgue-Stieltjes. Let $(f_1,f_2)_{\sigma_k} = \int\limits_{a_k}^{b_k} f_1(x)\overline{f_2(x)}d\sigma_k(x)$ and $\|f\|_{\sigma_k} = (f,f)^{1/2}_{\sigma_k}$.

Card 1/3

Quasi-Isometric Mapping of the Spaces of Functions $L^2_{\sigma_1}(a_1,b_1)$, $L^2_{\sigma_2}(a_2,b_2)$ SOV/20-128-3-6/58

The author constructs direct and inverse quasi-isometric integral transformations of the function spaces $L^2_{\sigma_1}(a_1,b_1)$ and $L^2_{\sigma_2}(a_2,b_2)$ one into the other, whereby these transformations are generated by kernels which are adjacent in a certain sense to the kernels of corresponding isometric mappings of the same spaces. Theorem 1 generalizes the theorem of Bochner [Ref 1] on isometric operators in the case of the spaces $L^2(a,b)$. Theorem 2 is a generalization of the theorem of Paley-Wiener [Ref 3] on isometric mappings of $L^2(a,b)$ and $L^2_{[x]}(0,+\infty)$. Theorem 3 gives a further generalization of theorem 1.

TITLE: Expansion in Special Biorthogonal Systems and Boundary Value Problems for Fractional-Order Differential Equations 16

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 132, No. 4, pp. 747-750

TEXT: The authors investigate special systems biorthogonal on the interval [0,1] which are formed by linear combinations of functions of the Mittag-Leffler type

(1) $$E_\rho(z;\mu) = \sum_{k=0}^{\infty} \frac{z^k}{\Gamma(\mu+k\rho^{-1})} \quad (\mu>0,\ \rho\geqslant\frac{1}{2}).$$

It is stated that the expansions in terms of these functions converge simultaneously with the ordinary Fourier series. On a finite interval the authors formulate conjugated boundary value problems for differential equations of fractional order $\frac{1}{\rho}$ $(\rho\geqslant\frac{1}{2})$, the adjoined and eigenfunctions of which for special parameter values agree with the considered biorthogonal

X

Card 1/2

TITLE: On the General Theory of Biorthogonal Kernels 16

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 132, No. 5, pp. 994-997

TEXT: The paper is a continuation of (Ref. 1). There was proved the existence of certain biorthogonal kernels $\tilde{K}(\xi, x)$, $\tilde{K}_*(\xi, x)$ in the Hilbert space $H_k = L^2_{\sigma_k}(a_k, b_k)$ of all functions which are σ_k - measurable and summable in the square on (a_k, b_k). Now $K(\xi, x)$ is called complete in H_1, if from $f(x) \in H_1$ and

$$\int_{a_1}^{b_1} K(\xi, x) \overline{f(x)} \, d\sigma_1(x) = 0$$

for all $\xi \in (a_2, b_2)$ it follows that $f(x) \equiv 0$. Every complete kernel is called kernel of an isometric operator, if for all $\xi, \eta \in (a_2, b_2)$ the condition

$$(6) \quad \int_{a_1}^{b_1} \overline{K(\xi, x)} K(\eta, x) \, d\sigma_1(x) = \int_{a_2}^{b_2} e_\xi(x) e_\eta(x) \, d\sigma_2(x) \quad \text{for all } \xi, \eta \in (a_2, b_2)$$

81690
S/020/60/132/05/06/069

is satisfied, where

$$(4)\quad e_\xi(x)=\begin{cases}1, & x\in[0,\xi)\\ 0, & x\bar{\in}[0,\xi)\end{cases}\quad \xi>0,\qquad e_\xi(x)=\begin{cases}-1, & x\in[\xi,0)\\ 0, & x\bar{\in}[\xi,0)\end{cases},\ \xi<0$$

The function $\widetilde{K}(\xi,x)$, $\xi\in(a_2,b_2)$, $x\in(a_1,b_1)$ is called B-kernel, if there is a $\widetilde{K}_*(\xi,x)$ such that

$$(1)\qquad \widetilde{K}(\xi,x)\in H_1,\ \widetilde{K}_*(\xi,x)\in H_1,$$

$$(5)\qquad \int\limits_{a_1}^{b_1}\overline{\widetilde{K}(\xi,x)}\,\widetilde{K}_*(\eta,x)\,d\sigma_1(x)=\int\limits_{a_2}^{b_2}e_\xi(x)\,e_\eta(x)\,d\sigma_2(x)$$

and furthermore that $\widetilde{K}$ and $\widetilde{K}_*$ are complete. $\widetilde{K}$ and $\widetilde{K}_*$ are called conjugate kernels. A B-kernel $\widetilde{K}(\xi,x)$ is called a Bessel kernel, if to every $f(x)\in H_1$ there corresponds a $g(\xi)\in H_2$ so that for all

Card 2/4

81690

S/020/60/132/05/06/069

On the General Theory of Biorthogonal Kernels

$\eta \in (a_2, b_2)$ it holds

$$(7)\qquad \int_{a_1}^{b_1} f(x)\,\overline{\tilde{K}_*(\eta,x)}\,d\sigma_1(x) = \int_{a_2}^{b_2} g(\xi)\,e_\eta(\xi)\,d\sigma_2(\xi).$$

A B-kernel $\tilde{K}_*(\xi, x)$ is called a Hilbert kernel, if to every $g(\xi) \in H_2$ there corresponds an $f(x) \in H_1$ so that

$$(9)\qquad \int_{a_1}^{b_1} f(x)\,\overline{\tilde{K}(\eta,x)}\,d\sigma_1(x) = \int_{a_2}^{b_2} g(\xi)\,e_\eta(\xi)\,d\sigma_2(\xi)$$

A B-kernel which is simultaneously Bessel and Hilbert kernel is called a Riesz-Fischer kernel.
In 10 theorems the author gives several statements on the introduced kernels, e. g.
Theorem 5: If a B-kernel is a Bessel kernel, then the conjugate kernel is a Hilbert kernel.

TITLE: The Problem of Moments and the Biorthogonalization of Kernels

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 132, No. 6, pp. 1250-1253

TEXT: The paper is a continuation of (Ref. 1) and (Ref. 2). The authors investigate the general continuable momentum problem. The results are used in order to biorthogonalize the so-called C-kernels. $\widetilde{K}(\xi,x)$, $\xi \in (a_2,b_2)$ and $x \in (a_1,b_1)$, is called a C-kernel if for all $\xi \in (a_2,b_2)$ it holds $\widetilde{K}(\xi,x) \in H_1$, where $H_1 = L^2_{\sigma_1}(a_1,b_1)$ is the Hilbert space of all σ_1-measurable functions being summable in the square on (a_1,b_1) and if in all points of continuity ξ_0 of $\sigma_2(\xi)$ it holds

$$(1)\quad \int_{a_1}^{b_1} |\widetilde{K}(\xi_0+\delta,x)-\widetilde{K}(\xi_0,x)|^2 d\sigma_1(x) \leq c(\xi_0)|\sigma_2(\xi_0+\delta)-\sigma_2(\xi_0)|^{\alpha(\xi_0)},$$

TITLE: Theory of the general kernel transformations

PERIODICAL: Akadimiya nauk SSSR. Izvestiya seriya Matematicheskaya, v. 25, no. 6, 1961, 825 - 870

TEXT: A general theory of the linear transformations of Hilbert-space functions $L^2_{\sigma_1}(a_1, b_1)$ into $L^2_{\sigma_2}(a_2, b_2)$ is developed. The indices σ_k refer to the weight functions $\sigma_k(x)$ that occur in the scalar products

$$(f_1, f_2)_{\sigma_k} = \int_{a_k}^{b_k} f_1(x)\overline{f_2(x)}d\sigma_k(x)$$

of $H_k = L^2_{\sigma_k}(a_k, b_k)$ $(k = 1,2)$. In particular, the linear (almost) iso-

30827
S/038/61/025/006/002/004
Theory of the general kernel transformations B112/B108

metric mappings of H_1 onto H_2 are investigated. The theorems derived concern the following types of kernels: Bessel kernels $\tilde{K}$:

$$\int_{a_1}^{b_1} \tilde{K}(\xi, x)\tilde{K}_*(\eta, x)d\sigma_1(x) = \int_{a_2}^{b_2} e_\xi(u)e_\eta(u)d\sigma_2(u), \qquad (1.6)$$

$$\int_{a_1}^{b_1} f(x)\overline{\tilde{K}_*(\eta, x)}d\sigma_1(x) = \int_{a_2}^{b_2} g(u)e_\eta(u)d\sigma_2(u), \qquad (1.7)$$

where $\tilde{K}_*$ is biorthogonally conjugate to $\tilde{K}$,

$$e_\xi(x) = \begin{cases} 1, & x \in [0, \xi), \\ 0, & x \bar{\in} [0, \xi) \end{cases} \qquad \xi > 0,$$

Card 2/4

Theory of the general kernel transformations S/038/61/025/006/002/004
B112/B108

($f \to g$). The relationship of such kernels with the kernels of isometric mappings is investigated. Necessary and sufficient conditions for the solvability of the general problem of moments in the spaces H_1 and H_2 are derived. The results obtained are generalisations of the well known results of N. K. Bari, which concern the kernels of biorthogonal transformations (Doklady Ak. nauk SSSR, 54 (1946), 383 - 386., Uch. zap. MGU, vyp. 148, t. IV (1951), 69 - 107., Doklady Ak. nauk SSSR, 33 (1941) 342 - 345.). There are 11 references: 8 Soviet and 3 non-Soviet. TITLE: Unitary pairs of operators and their analytic characteristic in the $L_2(a,b)$ space

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 141, no. 2, 1961, 281-284

TEXT: The notion of the unitary pair of operators is introduced and for this case the theorem of Bochner (Ref. 1: S. Bochner, K. Chandrasekharan, Fourier Transforms, Princeton, 1949, p. 150-156) on the analytic characteristic of unitary operators in $L_2(a,b)$ is generalized.

X

Let U_1 and U_2 be two linear bounded operators in the abstract Hilbert-space H with the range $\Delta_k = U_k H \subseteq H$ $(k = 1,2)$. Let U_1^* and U_2^* be the adjoint operators. The ordered pair of operators $\{U_1, U_2\}$ is called unitary, if for arbitrary $f \in H$, $g \in H$

$$(U_1^* f, U_1^* g) = (f,g); \qquad (1)$$

Card 1/7

30693

Unitary pairs of operators and . . . S/020/61/141/002/003/027
C111/C444

$$(U_1 f, U_1 g) + (U_2 f, U_2 g) = (f,g) \qquad (2)$$

(f,g) being the scalar product, generating the metric of H. The class of all those unitary pairs is called $\mathfrak{A}(H)$.

From the definition general properties are concluded:

A. In order a linear bounded operator U_1, given in H, to be unitary, it is necessary and sufficient that from $\{U_1, U_2\} \in \mathfrak{A}(H)$ follows $U_2 = 0$, 0 being the operator transforming all elements of H to zero.

B. If $\{U_1, U_2\} \in \mathfrak{A}(H)$, then the operators

$$P_1 = U_1^* U_1, \quad P_2 = U_2^* U_2 \qquad (3)$$

project the space H on subspaces H_1 and H_2 which are orthogonal complements of each other.

C. If $\{U_1, U_2\} \in \mathfrak{A}(H)$, then for arbitrary f and g of $\Delta_2 = U_2 H$ there holds

Card 2/7

30693

Unitary pairs of operators and . . . S/020/61/141/002/003/027
C111/C444

$$(U^*_2 f, U^*_2 g) = (f, g) \tag{5}$$

D. If a linear bounded operator U_1 satisfies the condition (1), then there exists a linear bounded operator U_2 (unique among positive self-adjoint operators) such that $\{U_1, U_2\} \in \mathfrak{A}$ (H).
The function e_ξ be defined by

$$e_\xi(x) = \begin{cases} 1, & x \in [0, \xi), \\ 0, & x \overline{\in} [0, \xi), \end{cases} \quad \xi > 0; \quad e_\xi(x) = \begin{cases} -1, & x \in [\xi, 0), \\ 0, & x \overline{\in} [\xi, 0). \end{cases} \quad \xi < 0 . \tag{6}$$

Let x be an inner or boundary point of (a,b).
Theorem 1: To every pair $\{U_1, U_2\} \in \mathfrak{A}$ (H), $H = L_2(a,b)$ there correspond four functions:

$$K(\xi, x) = U_1 e_\xi(x), \quad K^*(\xi, x) = U_1^* e_\xi(x)$$
$$R(\xi, x) = U_2 e_\xi(x), \quad R^*(\xi, x) = U_2^* e_\xi(x) \tag{7}$$

Card 3/7

30693

C111/C444

belonging to $L_2'(a,b)$ for every $\xi \in (a,b)$ and possessing the following property:

The correspondence

$$g_1 = U_1 f, \quad g_2 = U_2 f, \quad f = U_1^* g_1 + U_2^* g_2, \quad f \in H \qquad (8)$$

is realised by the formulas

$$\int_c^\xi g_1(x)\,dx = \int_a^b \overline{K^*(\xi, x)}\, f(x)\,dx, \quad \int_0^\xi g_2(x)\,dx = \int_a^b \overline{R^*(\xi, x)}\, f(x)\,dx, \qquad (9)$$

$$\int_?^\xi f(x)\,dx = \int_a^b \overline{K(\xi, x)}\, g_1(x)\,dx + \int_a^b \overline{R(\xi, x)}\, g_2(x)\,dx, \qquad (10)$$

and the correspondence

Card 4/7

30693

$$g = U_1^* f, \quad f = U_1 g, \quad f \in H, \tag{11}$$

is realised by the formulas

$$\int_0^{\xi} g(x)dx = \int_a^b \overline{K(\xi,x)}\, f(x)\, dx, \quad \int_0^{\xi} f(x)dx = \int_a^b \overline{K^*(\xi,x)}\, g(x)\, dx\,. \tag{12}$$

Besides the functions (7) satisfy the following equations

$$\left.\begin{array}{l} a)\ \int_a^b \overline{K(\xi,x)}\, K(\eta,x)dx + \int_a^b \overline{R(\xi,x)}\, R(\eta,x)\, dx \\ b)\ \int_a^b \overline{K^*(\xi,x)}\, K^*(\eta,x)\, dx \end{array}\right\} =$$

Card 5/7

30693
S/020/61/141/002/003/027
C111/C444

$$= \int_a^b e_{\xi}(x)\, e_{\eta}(x)\,dx = \begin{cases} \min(|\xi|, |\eta|) & \text{for } \xi\eta \geqslant 0, \\ 0 & \text{for } \xi\eta \leqslant 0; \end{cases}$$

X

c) $\int_0^{\eta} K(\xi, x)\,dx = \int_0^{\xi} \overline{K^*(\eta, x)}\,dx;$

d) $\int^{\eta} R(\xi, x)\,dx = \int_0^{\xi} \overline{R^*(\eta, x)}\,dx$

The converse: each system of four functions

$K(\xi, x)$, $K^*(\xi, x)$; $R(\xi, x)$, $R^*(\xi, x)$

which satisfies a), b), c), d), according to (9) - (10), (12) generates a certain unitary pair $\{U_1, U_2\}$ which is connected with these functions by (7).

Some conclusions of the theorem and the property D are given.

TITLE: Expansion with respect to systems of rational functions with fixed poles

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 143, no. 1, 1962, 17 - 20

TEXT: The author considers expansions

$$f(z) = \sum_{k=0}^{\infty} c_k M_k^{(s)}(z), \qquad z \in G^{(+)}.$$

The system of the rational functions $M_k^{(s)}(z)$ is introduced in the following way: Let $w = \Phi(z)$ be a conformal mapping of the region $G^{(-)}$ (which is complementary to the simply connected region $G^{(+)}$) into the region $|w|>1$, and let $\{\alpha_k\} \subset G^{(-)}$ be an arbitrary sequence of complex numbers. The Malmquist system

Card 1/3

$$\varphi_0(w) = \frac{(1-|\alpha_0|^2)^{1/2}}{1-\bar{\alpha}_0 w},$$

$$\varphi_n(w) = \frac{(1-|\alpha_n|^2)^{1/2}}{1-\bar{\alpha}_n w} \prod_{k=0}^{n-1} \frac{\alpha_k - w}{1-\bar{\alpha}_k w} \frac{|\alpha_k|}{\alpha_k} \quad (n = 1, 2, \ldots), \tag{4}$$

where $\alpha_k = \left[\overline{\Phi(\omega_k)}\right]^{-1}$, is orthonormal on the unit circle $|w| = 1$. For each ϱ with $1 < \varrho < R_n = \min\limits_{0 \leqslant k \leqslant n} \left\{|\Phi(\omega_k)|\right\}$, there is a curve $|\Phi(z)| = \varrho$ (designated by Γ_ϱ) which separates the region $G_\varrho^{(-)}$ from the region $G_\varrho^{(+)}$. The functions

$$M_k^{(1)}(z) = \frac{1}{2\pi i} \int\limits_{\Gamma_\varrho} \frac{\varphi_k[\Phi(\xi)]\,[\Phi'(\xi)]^s}{\xi - z} d\xi \quad (k = 0, 1, \ldots, n). \tag{5}$$

are defined for $z \in G_\varrho^{(+)}$, and

$$M_k^{(2)}(z) = \varphi_k[\Phi(z)]\,[\Phi'(z)]^s + \frac{1}{2\pi i} \int\limits_{\Gamma_\varrho} \frac{\varphi_k[\Phi(\xi)]\,[\Phi'(\xi)]^s}{\xi - z} d\xi \quad (k = 0, 1, \ldots, n). \tag{6}$$

for $z \in G_\varrho^{(-)}$. There are 3 references: 2 Soviet and 1 non-Soviet. The reference to the English-language publication reads as follows:

TITLE: Evaluation of holomorphic functions subject to additional conditions in a unit circle

SOURCE: Uspekhi matematicheskikh nauk, v. 20, no. 4, 1965, 148-150

TOPIC TAGS: function, mathematics

ABSTRACT: It is assumed that in the unit circle $|z| < 1$ there are given the points $(0 < |\alpha_k| < 1)$, which differ from one another. Designated by $B_1(\alpha_1, \ldots, \alpha_n)$ is a class of functions $f(z)$ which are holomorphic in the circle $|z| < 1$ and satisfy the conditions

$$|f(z)| < 1, \quad |z| < 1,$$

$$|f(\alpha_k)| \leq \varepsilon_k \quad (k = 1, 2, \ldots, n),$$

where $\{\varepsilon_k\}_1^n$ $(0 \leq \varepsilon_k \leq 1)$ are given numbers. The article considers the following theorem of S. Ya. KHAVINSON: If

Card 1/2

UDC: 517.5

L 29099-66

ACC NR: AP6019386

$f(z) \in B_1(\alpha_1, \ldots, \alpha_n)$, then given any z, $|z| < 1$, there occurs the inequality

$$|f(z)| < |B_n(z)| \left\{1+\sum_{k=1}^{n} \varepsilon_k \left(1-\left|\frac{z-\alpha_k}{1-\bar{\alpha}_k z}\right|^2\right)\left|\frac{1-\bar{\alpha}_k z}{z-\alpha_k}\right| \prod_{\substack{\nu=1\\ \nu\neq k}}^{n} \left|\frac{1-\alpha_\nu \bar{\alpha}_k}{\alpha_\nu-\alpha_k}\right|\right\},$$

where

$$B_n(z)=\prod_{\nu=1}^{n} \frac{z-\alpha_\nu}{1-\bar{\alpha}_\nu z}.$$

KHAVINSON proved this theorem by means of results on duality in extremum problems with additional conditions within a domain, as well as by using solutions to certain extremum problems in a circle. The author suggests that the last-mentioned inequality, as well as other more general inequalities in the class generally speaking of unbounded functions, can be established more simply and directly by using interpolation formulas. Orig. art. has: 14 formulas. [JPRS]

TITLE: Orthogonal systems of rational functions on the unit circle

SOURCE: AN ArmSSR. Izvestiya. Matematika, v. 1, no. 1, 1966, 3-24

TOPIC TAGS: orthogonal function, mathematics

ABSTRACT: This paper deals with the algebraic properties of systems of rational functions which are orthonormal on the unit circle with respect to the weight $(2\ )^{-1}$ d (x) and whose poles lie on a given sequence of points situated outside the unit circle. In the case in which all the poles of the system under consideration coincide with the point at infinity, the theorems proved here concur with the well-known assertions of the theory of orthogonal (with respect to the weight function) polynomials developed by Szegö ("Orthogonal Polynomials", Chpts. X and XI, M., 1962; "Toeplitz Forms and Their Application", Chpts. 2 and 3, M, 1961). Orig. art. has: 2 formulas. [JPRS: 36,712]

AUTHOR: DŽRBAŠJAN, V.A. PA - 2010

TITLE: The $\gamma - \gamma$ - Vortex Correlation in the Case of Meson Transitions.

PERIODOCAL: Zhurnal Eksperimental'noi i Teoret. Fiziki, 1956, Vol 31, Nr 6, pp 1090-1092 (U.S.S.R.)
Received: 1 / 1957 Reviewed: 3 / 1957

ABSTRACT: PODGORECKIJ, M.I. (Zhurn. eksp. i teor. fis., 29, 374, 1955) drew attention to a possibility of precisely determining the spin of a myon by using data concerning the angular correction between the directions of γ - quanta which were radiated on the occasion of successive mesoatom transitions. The present report investigats this problem and suggests a method for the verification of the spin of those nuclei in the case of which the value I=0 is doubtful and was determined only as a result of theoretical and experimentally not confirmed deliberations. The formulae obtained here are also suited for the determination of the spin of any mesons. In the case of light meson atoms ($Z<15$) the probabilities of radiation transitions are small compared to the probabilities of conversion transitions. In the case of heavy mesoatoms the probability of conversion transitions can be neglected if quantum numbers are low (n,l). Here an expression for the correlation function $W(\delta)$, which is suited for not very great Z ($15 < Z < 50$) is given, it is suited for the verification of the spin of those nuclei in which the value I=0 has not been confirmed by

experiment (e.g. $_{16}S^{34}$, $_{20}Ca^{40}$, $_{34}Se^{74}$). As an example it is shown that the anisotropy $A = 0,43$ and $0,25$ corresponds to the value $I = 0$ and $I = 1/2$ at the transitions $(1/2)(D)(3/2)(1/2)$. In heavy mesoatoms the finity of nuclear dimensions entails the necessity of computing the correlation function on the occasion of transitions of the type $l_A(L_1)l_B(L_2)l_C$. Here l_A, l_B, l_C denote the orbital moments of the meson in the initial, intermediate, and final states. In addition to super-fine structure, also fine structure must be taken into account in this case. Its contribution is based upon the fact that, because of spin - orbit-interaction as a result of the emission of the first quantum, orientation of the orbital moment in the intermediate state changes, whilst interaction with the nucleus changes the orientation of the total angular momentum $\vec{J}$. An expression for the correlation function for heavy mesoatoms (confined to electric transitions) is given. Also any additional interaction can be taken in account. The normalization $\int W(\vartheta) d\Omega/4\pi = 1$ applies. Next, some ideas expressed by PODGORECKIJ are criticized. In conclusion the values of the anisotropy A for the radiation transition $2s \rightarrow 2p \rightarrow 1s$ for various spin values of the myon (at $I = 0$) are given. If it is possible to measure anisotropy with an accuracy of at least 0,08, this suffices for the determination of the spin of the myon if the spin of the nucleus is equal to zero. If, however, the spin of the meson is 1/2, this accuracy suffices for the purpose of deciding whether the spin of the nucleus (e.g. $_{74}W^{182}$,

Title : Angular Correlation of Gamma Quanta, Emitted by Mesonic Atoms.

Orig Pub : Izv. AN ArmSSR, ser. fiz.-matem. n., 1957, 10, No 2, 81-88

Abstract : The author derives the value of the anisotropy A = W (180)/W (90) -1 for two gamma quanta, radiated by μ-mesonic atoms upon successive transitions of the meson from one level to another (W (ϑ) is the probability of successive radiation of quanta making an angle ϑ). The calculation is made for medium and heavy mesonic atoms, for which the dipole electric transitions play the principal part. Account is taken of the influence of the fine and

TITLE: The Influence of the Polarization of a Negative Myon Upon the Effect of the Correlation of γ-Rays Emitted by the Meso-atom (Vliyaniye polyarizatsii μ-mezona na effekt korrelyatsii γ-luchey, izluchayemykh mezoatomom)

PERIODICAL: Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, 1958, Vol. 34, Nr 1, pp. 260 - 260 (USSR)

ABSTRACT: It was recently experimentally determined (reference 2) that polarized negative myons are produced in the decay of negative pions. Therefore the investigation of the analogous problem at a given degree of polarization of the negative myon is of interest. The correlation function valid in the case of heavy mesoatoms for the cascade $l_A(L_1)l_B(L_2)l_C$ is explicitly given here and shortly explained. This correlation function depends on those angles which are enclosed by the axis of the rotation symmetry of the spins of the myon and the direction of emission of the first and second quantum. Moreover this correlation function is also dependent on the angle between these

Card 1/2

56-1-54/56

The Influence of the Polarization of a Negative Myon Upon the Effect of the Correlation of γ-Rays Emitted by the Mesoatom

two quanta. The correlation is not dependent on the degree of polarization of the negative myon, when the myon has the spin 1/2. But when the negative myon may also have the spin 3/2, the correlation function would be dependent on the degree of alignment. There are 3 references, 1 of which is Slavic.

TITLE: The Angular Correlation of Circularly Polarized γ-Quanta on a μ-Mesoatom (Uglovaya korrelyatsiya tsirkulyarno polyarizovannykh γ-kvantov na μ-mezoatome)

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958, Vol. 35, Nr 1, pp. 307 - 308 (USSR)

ABSTRACT: A μ- mesoatom produced by the capture of a polarized negative myon emits circularly polarized γ-quanta. Because of the spin-orbit interaction (which causes the depolarization of the negative myon on the orbit) the angular distribution and the angular correlation of these quanta depend on the degree of polarization of the negative myon. By comparison of the theory with the experiment, data concerning the degree of polarization ($|P|$) and the direction of the polarization (sign of P) of the negative myons produced in the decay of negative pions may be obtained. The correlation function may be calculated by using a formula which was obtained in one of the author's previous papers. The explicit expression for this correlation function is given and specialized for the case that the direction of the first quantum

Card 1/2

The Angular Correlation of Circularly Polarized γ-Quanta on a μ-Mesoatom SOV/56-35-1-57/59

coincides with the direction of the incident negative myons. Finally, the angular distribution for the transition 2p → 1s is obtained. The author thanks V.V.Vladimirskiy for his interest in this paper and K.A.Ter-Martirosyan for his useful discussion. There are 3 references, 1 of which is Soviet.

AUTHOR: Dzhrbashyan, V. A. SOV/56-36-1-39/62

TITLE: The Depolarization of a μ^--Meson in Mesic Atom Transitions (Depolyarizatsiya μ^--mezona pri mezoatomnykh perekhodakh)

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958, Vol 36, Nr 1, pp 277-282 (USSR)

ABSTRACT: The author first gives a short report on earlier papers dealing with this subject, on the basis of which he investigates the depolarization of a negative muon in electric dipole-transitions. The negative muon is assumed to go over by successive emissions of Ozhe-electrons from the level l_N to the level l_1, i. e. a declining cascade $l_N(l)l_{N-1}(l)l_{N-2}(l)$ .....$l(l_1)$ occurs. In order to determine the corresponding density matrix, it is necessary to solve the perturbational equation in a manner suggested by Wigner (Vigner) and Weißkopf (Vayskopf), by which the finity of level-width is taken into account. However, the author describes yet another method of determining a finite result. Interaction may be inserted into the expression for the transition probability by means of an operator acting upon the wave

Card 1/3

The Depolarization of a μ^--Meson in Mesic Atom Transitions

SOV/56-36-1-39/62

function of the meson on the given level. The (rather long) expression found for the density matrix is explicitly written down and explained. Depolarization is here defined as the ratio P/P_o, where P_o and P denote the degree of polarization of the negative muon immediately before and after the investigated cascade respectively. Depolarization depends only slightly on the orbital moment of the cascade and on the types of transitions occurring in the case of large l. Thus, in transition to the level n = 15, l_N = 14 there is a cascade with $\Delta n = \Delta l = -1$, and the corresponding depolarization is 0.179. Even in the case of the first radiation transitions, radiation to the circular orbit with $\Delta n = -2, \Delta l = -1$ is the most probable. The influence exercised by the electron shell may be neglected in the case of mesic atom transitions, because during the life-time of the levels of mesic atoms, the negative muon is not able to depolarize in this case. An exception is formed only by the final level 1s, the life-time of which is determined by the decay of the capture of a negative muon by a nucleus. The formula derived in the present paper is suited

Card 2/3

The Depolarization of a μ^--Meson in Mesic Atom Transitions

SOV/56-36-1-39/62

for nuclei with spin zero. Taking hyperfine structure into account leads to a greater depolarization of the negative muon. The author thanks K. A. Ter-Martirosyan for his constant interest in this work, and he also expresses his gratitude to A. I. Alikhanyan, M. L. Ter-Mikayelyan, and I. I. Gol'dman for discussing the results obtained. TITLE: Angular Distribution and Angular Correlation of Radiations of Nuclei With Orientated Electron Shells (Uglovoye raspredeleniye i uglovaya korrelyatsiya izlucheniy yader s oriyentirovannymi elektronnymi obolochkami)

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959, Vol 36, Nr 4, pp 1240-1245 (USSR)

ABSTRACT: If the life of the intermediate level is not small in comparison to the precession period of the nuclear moment in the electron shell field, interaction with the electron shell leads to a re-distribution of the m-sublevel, and a "perturbed" correlation of the nuclear radiations can be observed (cf. Ref 1). Alder developed a formula describing this effect (Ref 2) for electron shells which are in the steady state at nuclear transitions; Kester (Ref 3) investigated the deviations from Alder's formula for the case in which the conditions of the steady state are not satisfied. The author of the present paper investigates the angular correlation of two successive radiations of nuclei, both with respect to the direction and also of the polarization of the α- , β- , and γ-rays and of the

Card 1/3

Angular Distribution and Angular Correlation of Radiations of Nuclei With Orientated Electron Shells SOV/56-36-4-40/70

conversion electrons for the case of an orientated electron shell. The correlation function used by the author deviates from that used by Goertzel (Ref 1) and Alder; with an orientation of k-th degree ($k \neq 0$) the correlation order depends essentially on the initial nuclear level. By means of the derived function the anisotropy is by way of an example investigated for the case of the known γ-γ- cascade $7/2(1,2)\ 5/2(2)\ 1/2$ in Cd^{111} with a total momentum of the electron shell $j_e = 3/2$.

One obtains: $A_{unperturbed} = -0.247$, $A_{non\text{-}orientated} = -0.103$, $A_{tot.\ orientated} = -0.149$ and for $7/2(1)\ 5/2(2)\ 1/2$ the corresponding values -0.1034, -0.0417 and -0.1557 are obtained. The author finally thanks K. A. Ter-Martirosyan for his interest in this work. There are 9 references, 1 of which is Soviet.

TITLE: On a Possible Method of Determining the Polarization Direction of the μ^--Meson (Ob odnom vozmozhnom metode opredeleniya napravleniya polyarizatsii μ^--mezona)

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959, Vol 36, Nr 5, p 1572 (USSR)

ABSTRACT: A. Z. Dolginov (Ref 3) suggested that for the purpose of determining the direction of polarization of a μ^--meson originating from a π^--decay, the angular distribution of the circulary polarized γ- quanta be investigated which are emitted in the μ-mesoatomic transition 2p $\longrightarrow$ 1s. The expression for angular distribution contains the muon polarization P. In the present "Letter to the Editor" the author first gives a general expression for the angular distribution W of the circularly polarized γ-quanta for a transition $l_1 \longrightarrow l_0$ for the case in which the μ^--meson was captured into an orbit of the mesoatom with orbital momentum l_N. W is a function of l_i, P_0, τ and θ, where θ denotes the angle between the direction of emission of the γ-quantum and the direction of motion of the μ^--meson before

Card 1/2

On a Possible Method of Determining the Polarization Direction of the μ^--Meson SOV/56-36-5-46/76

capture on the l_N-orbit (i.e. the direction of the muon beam). For the special case $l_N = 14$, $l_1 = 1$, $l_0 = 0$, W is numerically computed and the following is obtained: $W = 1 - 0.102 \tau P_0 \cos \theta$. This formula gives the angular distribution of the circularly polarized γ-quanta emitted in a μ-mesoatomic transition $2p \to 1s$. (τ is a quantity which was introduced by the author in his previous papers (Refs 4-6). There are 6 references, 3 of which are Soviet.

TITLE: Dispersion formulas in the theory of nuclear excitation 19 51

SOURCE: AN ArmSSR. Izv. Seriya fiziko-matem. nauk, v. 16, no. 2, 1963, 87-100

TOPIC TAGS: inelastic scattering, nuclear resonance, coulomb excitation

ABSTRACT: The excitation state of nuclei under the impingement of high energy neutrons was studied. Differential excitation cross sections are considered first, using the dispersion relation for inelastic scattering in a coulomb field. This relation is derived from basic considerations in an appendix. The solution of the dispersion equation is carried out by dividing the differential cross sections into three excitation terms: coulombic excitation, interference between coulombic and nuclear resonance excitation, and pure nuclear resonance excitation. Integrating over the scattering angle, the total cross section of each excitation is obtained in the form of Legendre polynomials. The coulomb excitation term is identical with the formula given by K. Alder et al. (Sb. statey. Deformatsiya atomny*kh yader. IL, M., 1958).

Card 1/2

L 17973-63
ACCESSION NR: AP3000087

The nuclear resonance term gives the cross section for inelastic scattering whereas the interference term becomes significant for the high energy levels of the intermediate nuclei becoming negligible at lower levels when only the lowest values of the angular momenta are considered. The results compare favorably with existing experimental data. Orig. art. has: 67 equations and 1 figure.

Card 2/4

and
$$\sigma_2 = \frac{4\pi^2 \lambda_i^2}{(2I_i+1)(2s+1)} \sum_{l_i l_i' l_f l_f' J} (2J+1) \left| \sum_r \frac{U^{rJ}_{i l_i l_i} U^{rJ}_{f l_f l_f}}{E_i + W_{N_i} - W_{rJ} + i\Gamma_{rJ}/2} \right|^2 . \quad (5)$$

are obtained by substituting (3) in (1), summation over the magnetic quantum numbers, and integration over the angles. If the energy of the incident particles is near the level $W_{rJ}-W_{N_i}$, then

$$\sigma_2 = \pi\lambda^2 \frac{2J+1}{(2I_i+1)(2s+1)} \frac{\Gamma_i^{rJ}\Gamma_f^{rJ}}{[E_i-(W_{rJ}-W_{N_i})]^2+\Gamma_{rJ}^2/4} . \quad (6)$$

holds. The deviation of σ from $\sigma_1 + \sigma_2$ can be used to obtain knowledge of the matrix elements $U^{rJ}_{il_ij_i}$ and $U^{rJ}_{fl_fj_f}$ and to determine the sign of $\langle I_i \| \lambda \| I_f \rangle$. It follows from (4) that the contribution of the interference term, which is zero for S waves and small for P waves, becomes considerable for high levels of the compound nucleus. There is 1 figure.

TITLE: Electromagnetic excitation of a nucleus by a slow particle with arbitrary spin

SOURCE: AN ArmSSR. Izvestiya. Seriya fiziko-matematicheskikh nauk, v. 17, no. 5, 1964, 99-101

TOPIC TAGS: multipole interaction, nuclear excitation, magnetic spin interaction, magnetic orbit interaction

ABSTRACT: Formulas are derived for the cross sections of 2^{λ}-pole and magnetic spin and magnetic orbit interactions. The formula for magnetic orbit interaction is similar to that obtained by L. C. Biedenharn et al. (Phys. Rev. v. 100, 1955, 376) and differs from that of K. Alder et al. (Rev. Mod. Phys. v. 28, 1956) because of some errors in the latter. The cross section for the magnetic spin

interaction agrees with the results of the result of Biederhahn and Thaler (Phys. Rev. 104 v. 104, 1956, 1643) for s = 1/2 and s = 1. It is pointed out that for s > 1/2 (for example, excitation by deuterons) the M1 excitation cross section governed almost completely by the ratio of the two derived cross sections. Orig. art. has: 14 formulas.

solutions. In part one, the analysis is limited to the case of b = ∞, and the following special example is used

$$\int_a^\infty t^\lambda K_\nu^2(t)\,dt,$$

where $K_\nu(t)$ is a MacDonald function. This integral is defined in the manner

$$\int_a^\infty t^\lambda K_\nu^2(t)\,dt = \Phi_{\lambda,\,K_\nu^2}(\infty) - \Phi_{\lambda,\,K_\nu^2}(a),$$

its limit of convergence stated, and subsequently $\Phi_\lambda(\infty)$ and $\Phi_\lambda(a)$ are calculated in terms of gamma functions using methods outlined by G. I. Watson (Theory of Bessel Functions, 1949). In part two, b is assumed to be arbitrary, and the integral $\int_a^b$ is assumed to be the difference of $\int_a^\infty$ and $\int_b^\infty$. The limit "a" is assumed to be small, and the integral is represented by

$$\int_a^b t^\lambda K_\nu^2(t)\,dt \sim \Phi_{\lambda,\,K_\nu^2}(\infty) - \Phi_{\lambda,\,K_\nu^2}(a) - F_{\lambda,\,K_\nu^2}(b).$$

As an example, the following special case is investigated
